

Blender Asset Pilot — Micro-MVP

3D Sauna Configurator — Specification (German asset terms in parentheses)

Field	Detail
Document	Blender Asset Pilot — Micro-MVP
Prepared for	Development Interns (2)
Prepared by	KlarDataLabs India Pvt Ltd
Status	Draft v1.0
Date	2026-09-08
Reference source	Holzsauna by Holzbau Boscheri GmbH — Angebot A202607092848 (09.07.2026), used for dimensional/spec reference only
Additional visual reference	www.holzsauna.ch/Holzsauna-Fichte-Massiv (product photos — reference only, do not copy)

1. Goal

Before committing to the full sauna asset library, run a short pilot to validate the Blender-to-Three.js pipeline: model a small, realistic set of parts based on a real sauna's specifications, get them working together in the web viewer, and confirm every combination aligns correctly. This lets the team learn the workflow and surface problems while the cost of a mistake is still small.

2. Reference Source

Real-world dimensions and technical specifications for this pilot are taken from a supplier quotation for a "Sauna Espoo klein" cabin (Holzsauna by Holzbau Boscheri GmbH, Offer A202607092848, dated 09.07.2026). This document is used strictly as a dimensional and technical reference for modeling accuracy.

For additional visual reference (product photos, general solid-wood cabin construction), the interns can also browse: www.holzsauna.ch/Holzsauna-Fichte-Massiv

Important: Model original 3D geometry and materials from the dimensions/specs below. Do not copy the vendor's photographs, textures, or proprietary drawings — this is a competitor's commercial product, so the pilot must produce our own original assets, not a replica of theirs.

3. Assets to Build

Category	Reference spec	Variants for pilot
Base cabin (Grundkabine)	Solid wood, 45mm spruce, 140×120×202cm (W×D×H), front entry, wall-height window (Massivholz, 45mm Fichte, 140×120×202cm (B×T×H), Fronteinstieg, wandhohes Fenster)	1 fixed size
Door (Tür)	8mm ESG tempered safety glass, door seal, bar handle; hinge left OR right (8mm ESG-Sicherheitsglas, Türdichtung, Stangengriff; Anschlag links ODER rechts)	2: left-hinge / right-hinge (Anschlag links / rechts)
Heater (Saunaofen)	SAWOTEC Mini 3.6kW, stainless steel stone rack (SAWOTEC Mini 3,6kW, Steinrost aus Edelstahl)	2: integrated control (side-mounted) / external wall control (integrierte Steuerung (seitlich) / externe Wandsteuerung)
Lighting (stretch goal) (Beleuchtung, Stretch-Ziel)	Wood-shade wall lamp (E27, max. 40W) OR warm-white LED strip 2.5m (Saunaleuchte mit Holzblende (E27, max. 40W) ODER warmweisses LED-Band 2,5m)	Only if time permits

4. Combinations to Test

#	Door (Tür)	Heater (Ofen)
1	Left-hinge (Anschlag links)	Integrated control (Integrierte Steuerung)
2	Left-hinge (Anschlag links)	External control (Externe Steuerung)
3	Right-hinge (Anschlag rechts)	Integrated control (Integrierte Steuerung)
4	Right-hinge (Anschlag rechts)	External control (Externe Steuerung)

All 4 combinations must render with correct alignment — no gaps, clipping, or floating parts — for the pilot to be considered successful. The mirrored door is a deliberate test: it's a common source of alignment bugs when parts are swapped programmatically.

5. Technical Requirements

- Model in real-world scale (metres); check the cabin against a 1.7m human reference figure.
- Shared origin/pivot convention (floor level = Z0, centred on the back wall) so the door and heater snap into the cabin automatically when swapped.
- Export as .glb with Draco compression; each part as its own file, transforms applied before export.
- File names must match the config IDs used in the Asset Manifest, e.g. door_left-hinge.glb, heater_integrated-control.glb.

6. Success Criteria

- All 4 door × heater combinations align with no visual errors in a bare-bones Three.js test scene (no full UI needed).
- File sizes and load times are reasonable on a typical laptop and phone connection.
- The team can document the Blender → glTF workflow clearly enough to repeat it independently for the remaining ~15 assets in the full specification.

7. Timeline

Day	Task
1–2	Model base cabin + both door variants
3	Model both heater variants
4	Export all parts; build bare-bones Three.js test scene
5	Test all 4 combinations; document workflow; go/no-go review

Go/No-Go: If this pilot succeeds within the timeline, proceed to the full asset list (Section 6.3 of the main MVP specification). If not, revisit the pipeline before continuing.
